

Industrial Training Services

Incident free operations begins with qualified employees performing tasks in a safe manner at all times and skills in planning and following procedures. Although many employers believe that safe work habits are achieved through time and technical experience, safe operations begins with a solid foundation in safety training. Training objectives must be established and led by qualified instructors. The curriculum must satisfy and verify competence of the trainees. Once that is complete, employees must be refreshed periodically to keep skills fresh and to be advised of new regulations and best practices to work safely. CSS is a leader in industrial safety training.
